Evidence for gene conversion between the phosphoglycerate kinase of Trypanosoma brucei. 1

J. MOL. BIOL. 200:439-447(1988).

-I. CAPATUTIC ACTIVITY: ATP + 3-PHOSPHO-D-GLYCERATE - ADP +

3-PHOSPHO-D-GLYCEROYL PHOSPHATE.

-I. STALHWAY: SECOND STEP IN THE SECOND PHASE OF GLYCOLYSIS.

-I. SUBUNIT: MONOMER.

-I. SUBCELLULAR LOCATION: NOT KNOWN.

-I. SUBCELLULAR LOCATION: NOT KNOWN.

-I. SUBCELLULAR REGISTED CODE FOR PHOSPHOGLYCERATE KINASE

ISOZIMES, WHICH ARE TRANSPORTED TO DIFFERENT CELL COMPARTMENTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1988 (REL. 09, CREATED)

                                                                                                                                                                                                                                                              -1- CATALYTIC ACTIVITY: ATP + 3-PHOSPHO-D-GLYCERATE - ADP + 3-PHOSPHO-D-GLYCEROYL PHOSPHATE.

13-PHOSPHO-D-GLYCEROYL PHOSPHATE.

1- PATHWAY: SECOND STEP IN THE SECOND PHASE OF GLYCOLYSIS.

1- SUBGELLULAR LOCATION: CYTOPLASMIC.

1- SUBCELLULAR LOCATION: CYTOPLASMIC.

1- IN T. BRUCEL, THREE GENES CODE FOR PHOSPHOGLYCERATE KINASE ISOZYMES, WHICH ARE TRANSPORTED TO DIFFERENT CELL COMPARTMENTS.

1- SIMILARITY: BELONGS TO THE PHOSPHOGLYCERATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        , 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PATHWAY: SECOND STEP IN THE SECOND PHASE OF GLYCOLYSIS. SUBUNIT: MONOMER (BY SIMILARITY). SUBCELLULAR LOCATION: GLYCOSOWAL. SIMILARITY: BELONGS TO THE PHOSPHOGLYCERATE KINASE FAMILY.

Claim 13; Figure 18; 139pp; English.
It is the sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 14c. Tag a = the region of overlap with the HCV antigen encoded in clone 25c. It is an epitope which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.
                                                                                                                                                                                                                                               D 26-JUL-1989.

T POIVPEPTIAGE(s) and antibodies for diagnosis, prevention and Treatment of infection.

T Lreatment of infection.

C The sequence is the peptide encoded by the hepatitis C virus (HCV) cDNA insert in clone 14c (see N90319). The polypeptides (C are used to diagnose HCV induced NAMBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.

C The region shown overlaps with clone 25c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 80; DB 1; Length 170;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New plasmid pHCV-162 is a mammalian expression systems for HCVD proteins - useful for diagnosing HCV infection and as vaccines proteins - useful for diagnosing HCV infection and as vaccines proteins - useful for diagnosing HCV infection and as vaccines is Example 1; Page 39-49; 100pp; English.

Example 1; Page 39-49; 100pp; English.

C Gesignated from the plasma of a HCV seropositive human (designated "LG") and cDNA was prepared from it. The cDNA sequence (ERNANK M62321). Further amplification using nested primers resulted in 7 adjacent HCV DNA fragments which could be assembled into a full-length sequence. The CDNA sequence. Comparison of the LG genomic amino acid sequence with that from HCV-1 showed 134 amino acid differences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                               HCV genes and the corresponding proteins - used in the production of anti-HCV antibodies and the detection of HCV infection colaim 11; Pages 18-32; 35pp; Japanese. (74770 encodes R66995 the HC-J1/protein, the cDNA can be used in the construction of an expression vector for the transformation of a host cell, ran then be used in the production of proteins and peptides, useful in the preparation of monoclonal and polyclonal HCV-specific antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ន

Hepatitis C virus; NANBH; non-A, non-B hepatitis; CMP-KDO synthetase; non-structural protein; pHCV-45; diagnosis; CKS fusion protein; CTP:CMP-3-deoxy-manno-octulosonate cytidylyl transferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                        Monoclonal antibodies to hepatitis C virus NS5 proteins - used in diagnosing hepatitis C infections and differentiation studies Disclosure; Page 27; 38pp; English.
The sequence is that of an E. coli derived fragment of Hepatitis C virus NS5. The sequence may be used to raise monoclonal antibodies which specifically bind HCV NS5 antigen and to produce the hybridoma See also R33442-4.

Example 7: Rage Sc5-57: 164pp: English.
Bight oligonucleotides representing amino acids 1932-2191 of the HCV genome were ligated together and cloned as a 793bp EcoRI/BamHI fragment into the CKS fusion vector pJ0200. The complete DNA sequence of this plasmid is designated pHCV-45. The resultant fusion protein HCV CKS-NS5E consists of 239 amino acids contributed by linker DNA sequences and 260 amino recombinant HCV CKS-NS5E antigen was immunoractive with human serum samples containing HCV antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 80; DB 6; Length 516;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determination of antibody in sample - uses peptide analog absorbed or chemically bound on carrier as antigen Disclosure; Page 5: 13pp. Japanese.

This sequence represents the Hepatitis C virus (HCV) non-structural (NS4) protein. The invention relates to peptide analogues derived from HCV protein. The invention relates to peptide analogues derived antibodies in a sample. Preferably the peptide analogues contain one or more thioamide peptide bonds where at least one oxygen atom of the peptide bond is replaced by sulphur atom. The peptide analogues analogues can be adsorbed or chemically bound to a carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4

Combinations of synthetic Hepatitis C Virus antigens - provide more effective diagnosis of Non-A, Non-B Hepatitis
Claim 8; Fig 1(A-Y); 53pp; English.
The combination comprises an HCV antigen from the C domain (pref. C22 - R90936) and at least one HCV antigen from the NS3 (pref. C33c - R90932), NS4 (pref. C100 - R90933), S (pref. S2 - R909955) or NS5 (R90934) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    Eight oligonucleotides representing amino acids 1932-2191 of the HCV genome were ligated together and cloned as a 793 base pair EcotF BamHI fragment into the CKS fusion vector pu0200. The control of the lac promoter. The recombinant antigen consists of 239 amino acids of CKS, nine amino acids contributed by linker DNA sequences and 260 amino acids from the HCV NS4/NS5 region (1932-2191). The recombinant antigen can be used to detect antibodies and antigen in body fluids from individuals exposed to

The polypeptide (mol.wt. 55 kD) represents a distinct antigenic region of the HCV genome and can be used for the detection of antibodies and antigens for early diagnosis of HCV infection. The polypeptide can also be used to develop specific inhibitors of viral replication and for therapeutic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /label= NS5-E

                                                                                               New recombinant NSS region antigens - for hepatitis C assay for detecting hepatitis C virus infections

Claim 1, Page 36-318, 164pp; English.

Claim 1, Page 36-318, 164pp; English.

Claim 1, Page 36-318, 164pp; English.

Eight oligonucleotides representing amino acids 2188-2481 of the HCV genome were ligated together and cloned as a 895bp EcoRI-BamHI fragment in the vector DAC200 (i.e. pBR322 having a modifited lac promoter fused to part of the CKS gene and contg. a synthetic linker) to produce pHCV-48. The construct pHCV-45 was prepared by cloning a 793bp fragment representing HCV amino acids 1932-2191 into pJC300.

The Sall-BamHI fragment from pHCV-48 was ligated into the Sall-BamHI vector backbone of pHCV-45 to give an insert representing AAs 1932-2491 of HCV. The resulting 1650bp EcoRI-BamHI fragment was cloned into pJC300 to produce pHCV-59. The amino acid sequence of the resultant fusion antigen HCV KKS-NKS EF consists of 239 amino acids of CKS, 9 linker amino acids and 550 amino acids from the NS5 region of the HCV genome. The fusion protein is useful in immunoassays, for detecting anti-HCV antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     It is the sequence encoded in the open reading frame of hepatitis C virus CDNA inserts in clones 141,m 11b, 7f, 7e, 8h, 33c, 40b, 37b, 35, 36, 81, 32, 33b, 25c, 14c, 8f, a33f, 33g and 39c. It is antigenic and could be used in immunoassay reagents and vectines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  - and associated nucleic acids and polypeptide(s)

These antigens

Hepatitis C virus gene - used for prodn. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.

Disciosure: fig 26; 30pp; English.

The sequence is encoded by the composite cDNA of N90327. These anticreact with antibodies in patients with non-A non-B hepatitis (NANBH). They can be used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.

Sequence 1786 AA;

## DBP is a multifunctional protein found in plasma ascitic fluid, cerebrospinal fluid, and urine and on the surface of many cell types. In plasma, it carries the vitamin D sterols and prevents polymerization of actin by binding its monomers. DBP associates with membrane-bound immunoglobulin on the surface of B-lymphocytes and with 19G Fc receptor on the membranes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

DBP is a multifunctional protein found in plasma, ascitic fluid,
cerebrospinal fluid, and urine and on the surface of many cell
types. In plasma, it carries the vitamin D sterols and prevents
polymerization of actin by binding its monomers. DBP associates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ##residues 1-167,'E',169-326,'R',327-431,'E',433-435,'T',437-474

```

```
with membrane-bound immunoglobulin on the surface of B-lymphocytes and with IgG Fc receptor on the membranes of T-lymphocytes.

Over 80 variants of human DBP have been identified. The three most common alleles are called Gclf, Gcls, and Gc2.
                                                                                                                                                                                                                                                                                            #domain signal sequence #status predicted #label SIG\

FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHORIC, SOGGESTING A POSSIBLE MEMBRARAR-REALFED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
I-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN BURNELOPE. CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RNA-DIRECTED RNA POLYMERASE (NS5)

J. BIOCHEM. 20:1343-1349(1988).

-1- FUNCTION: MULTIFUNCTIONAL PROTEIN FOUND IN PLASMA, ASCITIC FLUID, CEREBROSPINAL FLUID, AND URINE AND ON THE SURFACE OF MANY CELL TYPES. IN PLASMA, IT CARRIES THE VITAMIN D STEROLS AND PREVENTS POLYMERIZATION OF ACTIN BY BINDING ITS MONOMERS. DBP ASSOCIATES WITH MEMBRANE-BOUND IMMUNGLOBULIN ON THE SURFACE OF B-LYMPHOCYTES. AND WITH IGG FC RECEPTOR ON THE MEMBRANES OF T-LYMPHOCYTES.
-1- SUBCELLULAR LOCATION: EXTRACELLULAR DOMAINS.
-1- DOMAIN: COMPOSED OF THERE HOMOLOGOUS DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-MAY-1991 (REL. 18, LAST SEQUENCE UPDATE)

Mean 26.730; Variance 108.537; scale 0.246 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This is the amino acid sequence of a novel Bacillus thuringlensis toxin used in the method of the invention, to control lepidopteran pests.

The new toxins are useful as pestlides, especially for the control of ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynuclectide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-DEC-1998 (first entry)
Amino acid sequence of lepidoteran-active HD573 toxin.
HD573 toxin: PCR: primer; amplification; Bacillus thuringlensis; probe; lepidoptera; pest; pesticide: Ostrinia nubilalis; Heliothis virescens; Helicoverpa zea; hybridisation.
Bacillus thuringlensis.
                                                                                                                                                                                                                                            Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using immuno-assays and nucleic acid hybridisation of Laim 10: Page 17-24: 29pp: Japanese.

This sequence represents a Hepatitis E viral hollow particle protein. This polypeptides can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      572 frtsfydgavleangperynlsfdasgstmaagpfsptyaasaaglevryvaagldhrav 631

Disclosure; Page 57-62; 114pp; English.
The sequences given in R51264-66 are encoded by the hepatitis E virus (HEV) strain SAR-55. The clonk sequence contains three open reading frames (ORFS). These proteins can be used to stimulate the production of protective antibodies upon injection into a mammal that would serve to protect the mammal upon challenge with wild type HEV. The proteins SAR-55 CDNA mas isolated from diagnosis of HEV infection. The HEV suspensions obtained from hepatitis E patients.

Disclosure; Pages 9-13; 121pp; English.

The present sequence is the protein prod. of ORF-1 from the hepatitis E virus (HEV) strain SAR-55, which was implicated in an enterically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the etection of HEV antibodies (pref. IgG or IgM) in blood, plasma, sera, cerebrospinal fluid, tissue, urine or pleural fluid. The protein, and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than
                                                                                                                     Claim 22; Columns 57-66; 47pp; English.

W80196-98 are encoded by the genome of the Burma strain of enterically transmitted non A non B hepatitis virus (ET-NANB)

(hepatitis E virus (HEV)). The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORFI sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NANB.

Disclosure; Columns 55-64; 45pp; English.
W/1209-11 represent the proteins encoded by the open reading frames (OREs) of the DNA sequence of the Burmese isolate of an enterically transmitted nonA/nonB viral hepatitis agent (ET-NANB). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV). detecting ET-NANB in infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in

Personal and products for diagnosis of, and vaccination against hepatitis E virus infection

Disclosure; Pages II-15: 20 kpp; English

This represents a hepatitis E virus (HEV) open reading frame (ORF)-1

Protein encoded by a DNA sequence designated SAR-55. SAR-55 also encodes

HEV MRF-2 and ORF-3 proteins. A host conganism transformed or transfected

With a recombinant expression vector containing the SAR-55 nucleic acid

can be used to produce the HEV proteins, especially ORF-2 protein. The

recombinant HEV proteins can be used as diagnostic agents and as vaccines

for use against HEV infection. The detection of antibodies specific for

HEV, and for monitoring the progression of such diseases. Such methods are

also useful for monitoring the efficacy of therapeutic agents during the

course of treatment of HEV infection and disease in a mammal. The

antibodies can be used for detection or for passive immunisation of

controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Helicoverpa zea Heliothis virescens and Helicoverpa zea Claim 14, Pages 32-34; 50pp; English.
This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pestficides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3

A positive clone ET1.1 was identified in a library prepared from blie of cynomolgus monkeys infected with the Burma strain of ET-NANB. Both strands of ET1.1 were sequenced indentity of the sequence with sequences in etiologic agents has been confirmed by locating a similar sequence in a viral strain isolated in Burma. This protein is encoded by the longest ORF (ORF 1) of the Burma strain. Sequence 1693 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  511 fisekfgngsdalrfegsnttarytlrgngnsynlylrvssignstirvtingrvytas 569

NAME OF THE PROPERTY OF THE PR

```
02-MAR-1990 (first entry)
Sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 14c.
Hepatitis C virus (HCV); non-A, non-B hepatitis (HANBH).
Hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and associated nucleic acids and polypeptide(s)

Claim 13: Figure 18: 139pp; English.

It is the sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 14c. Tag a = the region of overlap with the HCV antigen encoded in clone 25c. It is an epitope which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive sequence 170 AA;
                                                                                                                                                                                                                                                                                                                     Example 1: Page 39-49; 100pp: English.

RNA was isolated from the plasma of a HCV seropositive human (designated "LG") and cDNA was prepared from it. The cDNA was PCR amplified using specific primers with sequences based on the prototype HCV-1 cDNA sequence (GENBANK M6231). Further amplification using nested primers resulted in 7 adjacent HCV DNA fragments which could be assembled into a full-length sequence. The DNA sequence was determined and translated into the genomic amino acid sequence. Comparison of the LG genomic amino acid sequence.

With that from HCV-1 showed 134 amino acid differences.
    HCV genomic amino acid sequence isolated from infected human LG. Hepatitis C Virus; Non-A, non-B hepatitis Virus; HCV; NANBHV; human growth hormone; HGH; secretion signal; fusion protein;
                                                                                                                                                                                                                                                                                 New plasmid pHCV-162 is a mammalian expression systems for HCVD proteins - useful for diagnosing HCV infection and as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2116 vpspeffteldgvrlh-rfappckpllrdevsfrvglhdypvgsq 2159
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          63 vpspeffteldgvrlh-rfappckpllreevsfrvglheypvgsq 106

                                                                                                                                                                                                                                                                      New insecticidal Bacillus thuringlensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, that other controlling lepidopteran pests, especially Ostrinia nubilalis, that other controlling lepidopteran pests. Claim 5: Pages 36-38: 50pp; English.

This is the amino acid sequence of a novel Bacillus thuringlensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.

Q74770 encodes R66995 the HC-JI/protein, the CDNA can be used in the construction of an expression vector for the transformation of a host cell. The host cell can then be used in the production of proteins and peptides, useful in the preparation of monoclonal Sequence 3011 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-AUG-1995 (first entry)
Hepatitis C virus gene HC-J1/protein.
Hepatitis C virus; HCV gene HC-J1/protein; specific antibodies.
Hepatitis c virus.
